Brazil Macro Monthly

Better forecasts create good momentum, despite challenges

- Continued upside surprises to activity and inflation data in the US require tight monetary policy for longer, and we now see the Fed cutting rates in Q3 (Q2 before). In China, additional monetary and fiscal stimulus may boost demand in the short term, although momentum is weaker, and we still see growth below 5% ahead;
- In Brazil, we revised our projection for 2024 GDP growth, to 2.0% from 1.5%. Rising disposable income and gradually improving credit conditions should support domestic demand in the short term. We anticipate the same pace of economic growth for 2025;
- Stronger revenue in January does not change our expectation for a public sector deficit of 0.6% of GDP in 2024 and 1.0% of GDP in 2025. Starting next month, most of the measures approved last year will begin to impact primary revenue;
- While global risk aversion continues to challenge the exchange rate, the robustness of the trade surplus and the solid balance of payments are key drivers for a currency appreciation outlook by the end of the year;
- Services prices remain concerning in the short term, reflecting a tight labor market and solid domestic demand. However, we have lowered our IPCA projection for 2024 to 3.5%, reflecting benign food and electricity prices. For 2025, we maintain our projection at 4.0%;
- Lower inflation allows the Copom to keep signaling additional interest rate cuts. We project the Selic rate at 9.00% at the end of the monetary easing cycle, although strong demand brings the risk of a rise.

Foreword – Heaven on Earth?

The Brazilian economic outlook for 2024 has improved. We now expect stronger GDP growth (2.0% vs 1.5% before) and lower IPCA inflation (3.5% vs. 3.7%) in 2024. Moreover, tax collection hit a record high in January, and the trade surplus keeps topping expectations. Who could ask for more?

Still, Brazilian asset prices are not doing so great so far this year. Challenges, indeed, remain.

Globally, inflation seems to be stabilizing at a level still relatively elevated. The labor market remains tight in several Western economies, keeping services prices under pressure. Commodity prices rebounded somewhat, softening cost-push disinflation. Under those circumstances, the Fed and the ECB will not cut rates so soon, reverting the market´s (over)optimism created late last year.

In Brazil, economic growth has been solid, but with a worrisome composition. Consumption, boosted by government transfers and rising real labor earnings, is the main driver, along with commodity exports. Gross fixed capital formation, in turn, fell by 3% last year. It does not bode well for medium-term sustainable growth. Indeed, labor market may already be entering overheated territory.

Fiscal dynamics also remain a risk despite a good start of the year. Even considering the better performance in primary revenue, we still see a fiscal deficit north of 0.5% of GDP in 2024, and that will probably widen in 2025 without this year's one-off revenue gains.

Against this backdrop, the Copom should continue to gradually cut interest rates (by 50bps per meeting, eventually slowing to 25bps) until the Selic reaches around 9.00%. Currently, a higher terminal rate looks more likely than otherwise.

Global backdrop – Rate cuts still loading

Francisco Nobre

The timing of the US easing cycle remains uncertain. Economic indicators reinforce that the labor market remains tight, consumption growth remains robust, and inflation lingers above the 2% target. Of particular concern, hot services inflation prints (both in the CPI and PCE indices) show a clearer reinflationary trend. The services sector tends to be more sensitive to the tight labor market and is, therefore, expected to remain sticky in the short term. Hawkish data has driven markets to significantly reprice monetary easing expectations over the past two months from 6-7 cuts in 2024 to only 3-4 cuts.

We now see the Fed cutting rates in Q3 (Q2 before). Recent information reinforces the view that the final stage of the disinflation process will prove sticky due to the tight labor market, above-equilibrium wage growth, and low productivity gains. The current macroeconomic outlook suggests that there is no need for the Fed to rush rate cuts, and the risk of cutting too soon certainly outweighs the risk of cutting too late. Against this backdrop, **we see the Fed starting its easing cycle in July, cutting rates by a total of 100 bps throughout 2024 (150 bps before).** We still see the Fed reaching between 3.0-3.5% in 2025, which we consider will be the new neutral level.

The ECB should remain in watch mode. The Eurozone economy is weaker than its peers, but the first two HICP inflation prints of the year showed that inflation remains stubbornly above the ECB target. Energy prices have moderated more than expected in the region, although are not expected to feed through to wages or core HICP inflation. Inflation and wage growth should continue to moderate gradually, and we expect the ECB to start cutting rates in June.

In China, additional stimulus may boost demand in the short term, although we still see weaker growth ahead. At its February meeting, the PBoC cut its 5-year loan prime rate for mortgages by 25 bps to 3.95%, as the board increased efforts to spur credit demand and reverse a property downturn. Meanwhile, the 1-year loan prime rate was retained at 3.45%. Both key lending rates are at record lows. Also, the central bank recently injected CNY 1 trillion of liquidity into the banking system. These efforts may support economic activity in the short term, although GDP growth should fall below the renewed 5% target in the coming years

due to weakness in the real estate sector, slow consumption growth, and the soft labor market.

The uptick in commodity prices should be monitored. Agricultural and metal commodities have been well-behaved due to weaker global demand, especially from China, as well as record harvest gains. Despite the recent pickup in foodstuff, it remains at its lowest levels since late 2021. On the other hand, Brent oil prices increased almost 10% in February, partially reversing the fall observed in 4Q23. The risk of additional upside shifts cannot be ruled out due to lingering geopolitical tensions, which, if persistent, would pressure global inflation.

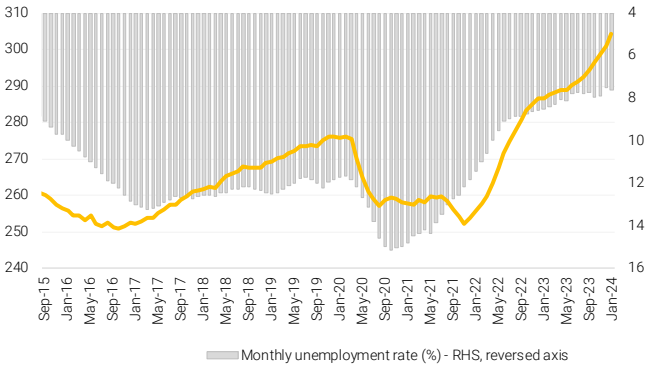
BRAZIL – Better forecasts create good momentum, despite challenges

Activity – We raised our projection for 2024 GDP growth, to 2.0% from 1.5%

Rodolfo Margato

Brazil's GDP increased by 2.9% in 2023, despite stability in the second half. Domestic activity advanced, for the second consecutive year, well above initial projections. This occurred despite the stability recorded in 3Q and 4Q. Sectors less sensitive to the economic cycle contributed substantially to overall GDP expansion last year. We estimate that agriculture, livestock, and extractive industries together accounted for 1.3pp of total economic growth. The record grain harvest – registered in the first half of the year – and the sharp increase in oil production played a leading role in the period. Furthermore, the real household disposable income jumped by around 6.5% in 2023, in line with the massive fiscal transfers and the tight labor market, which boosted consumption (especially of services). For a detailed analysis of the 4Q23 GDP, click here.

Real aggregate wage bill continues on a strong growth path
Seasonally adjusted data series

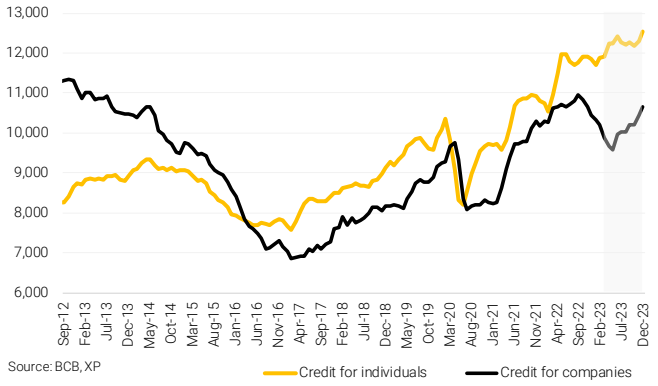


Source: IBGE, XP

We raised our projection for 2024 GDP growth, to 2.0% from 1.5%. In our previous macro monthly report, we made clear the positive bias for the expectation of a 1.5% increase this year. Although 4Q GDP was subtly below our estimate, its breakdown results provided some encouraging signs. For example, total industry and services linked to household demand have gained steam in recent months. In our opinion, the next quarterly releases will show a recovery in GDP growth.

Income impulses remain and credit conditions gradually improve. Among the fundamentals behind our review for economic activity in 2024, we highlight: (i) the solid labor

Credit concessions for companies are recovering
Real daily average, seasonally adjusted, 3MMA (BRL million)



Source: BCB, XP

market; (ii) the additional injection of resources with the payment of Court-ordered debts at the beginning of the year; (iii) the gradual improvement of the credit market, including the rise in non-earmarked concessions for companies and lower delinquency rates; and (iv) exports at all-time highs, despite the decline in commodity prices. As a result of the first two factors listed, we anticipate that the real household disposable income will grow by around 4.5% this year, supporting consumption in the short term.

Nonetheless, important risks remain on the radar, especially regarding investment dynamics. The expectation of higher GDP growth does not erase relevant sources of concern in 2024. First, investment in fixed assets remain at low levels (Gross Fixed Capital Formation plunged 3% last year), and we see no clear signs of recovery in the short term. For a more in-depth assessment on this subject, see our report *Outlook for Investments in 2024 and 2025*. Moreover, the lower income in the agricultural sector may impact the dynamics of other activities in the current year.

Regarding the labor market, a possible overheating could reverse the disinflation process. The unemployment rate remains at its lowest level since the beginning of 2015 (around 7.5%), in line with the labor force participation rate still far below pre-pandemic values and the solid rise in the employed population. In this context, real wages have been growing above expectations, intensifying concerns about services inflation and, consequently, the Central Bank's room to cut interest rates (see section on *Monetary Policy*). We project that the unemployment rate will end 2024 at 7.8%, while the real average labor earnings is expected to increase by 1.8% this year. Our base scenario considers a tight labor market, not an overheating one. But this risk should be closely monitored.

Finally, we continue to forecast that GDP will increase by 2.0% in 2025. The later start of the monetary easing cycle in advanced economies – particularly in the US – counterbalances the higher statistical carry-over effect from 2024 GDP. We project economic growth close to potential.

Brazil's GDP is expected gain to steam in the coming quarters

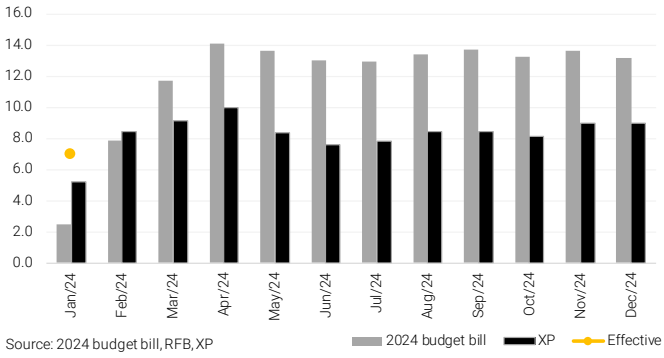
Public finance – Stronger collection does not change our scenario

Tiago Sbardelotto

January saw record tax collection. In real terms, federal tax collection grew by 6.7% compared to January last year. An important part of this gain came from extraordinary measures, but even without these, there was still a

Tax revenue must grow 13% in real terms for the government to reach the fiscal target
YTD variation in real terms (%)



Source: 2024 budget bill, RFB, XP

significant increase, especially in payroll taxes. Despite the record collection, January's primary balance fell by 3.8% compared to the same month last year, reaching BRL 79.3 billion.

February and March will be key to showing whether there will be a change in the tax collection level. The government expects revenue to grow by an average of 17.8% in real terms over the next few months, while we expect a more moderate gain of around 12% on average. In any case, this is a change in level (and trend) compared to 2023.

We maintain our projection of a deficit of BRL 74.5 billion (0.6% of GDP) in 2024. January's result was in line with our projection, without bias. In addition, we see that the changes in forecasts for inflation and economic activity (see the corresponding sections in this report) offset each other, with negative and positive effects on revenue, respectively.

The biggest risks lie on the revenue side. The government backed down and maintained the payroll tax exemption but is struggling to keep other tax benefit reversals. Together, these programs could cost BRL 22 billion this year. Also on the expenditure side, social security benefits and social assistance (BPC/LOAS) are underestimated in the budget. Given the limit imposed by the current fiscal framework, it will be necessary to reduce other expenses to accommodate these pressures.

2025 discussions will begin soon. The primary result target for 2025 is a surplus of 0.5% of GDP, an additional effort compared to the zero-deficit target for 2024. However, a significant part of the 2024 revenue (BRL 60 billion) is non-recurring, which means that the structural level is lower. In addition, there are court-ordered debt expenditures that must be paid outside the limit and the target next year. **Thus, we expect a deficit of BRL 132.3 billion (1.1% of GDP).**

The consolidated public sector (including states, municipalities, and state-owned companies) still runs a deficit. The combination of falling tax collection and lower federal government transfers drove subnational entities to their worst result since 2018 last year. We believe higher transfer will bring some relief in the short term. Nonetheless, subnational governments should continue to face fiscal pressure. As a result, we estimate a public sector deficit of BRL 67.7 (0.6% of GDP) in 2024 and BRL 122.6 (1.0% of GDP) in 2025.

Public debt maintains an upward trend, with moderation at the margin. Public debt grew by 2.7 p.p. of GDP in 2023. Although at a more moderate pace, thanks to improved fiscal results, lower interest rates and lightly more favorable

growth, public debt should remain on an upwards trend. Therefore, we project that debt will reach 77.2% of GDP (77.4% before) in 2024 and 79.4% of GDP in 2025 (79.6% before). If the current fiscal framework is maintained, we see debt stabilizing only at the beginning of the next decade.

The government gained time to change the primary target. The stronger-than-expected tax collection at the start of the year bought time for the government, avoiding a change to the primary fiscal target in March. The government will be able to increase the spending limit in May, given that the new fiscal framework allows to incorporate the difference between last year's adjustment (1.7%) and the framework limit (2.5%) - if estimated revenue for 2024 grows by more than 3.6%, compared to 2023. **We believe that if the government wants to avoid the triggers within the new fiscal framework, it should only change the target in the second half of the year, during next year's budgetary discussions.**

Public debt continues to grow in the upcoming years

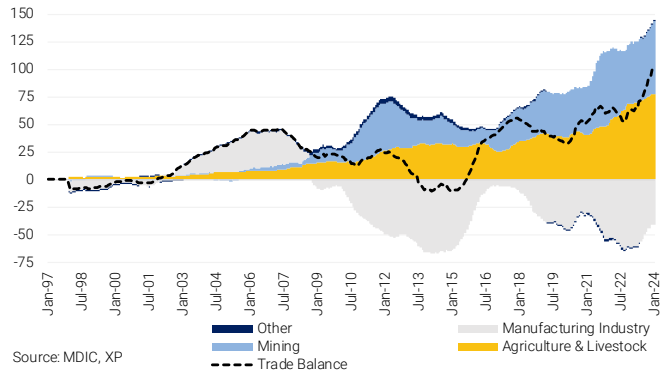
External Accounts – The trade balance continues to surprise to the upside, while exchange rate remains under pressure

Rodolfo Margato

In the short term, the global scenario continues to pressure the exchange rate... The market's repricing of monetary easing expectations in the United States (see the "Global Backdrop" section), along with the recent drop in agricultural and metallic commodity prices, is keeping the exchange rate under considerable strain. The DXY index, which tracks the dollar's performance against a basket of major currencies, has increased by nearly 3% since the end of last year. This dynamic is further intensified by geopolitical tensions, which increase global risk aversion.

...still, the robustness of the balance of payments underscores a pathway for appreciation until the end of the year. Our exchange rate forecast remains unchanged at R$/US$ 4.70 by the end of 2024, despite higher depreciation in the first half (around R$/US$ 5.00). The strong performance of Brazil's external accounts reinforces our confidence in the potential for currency appreciation. Looking ahead to 2025, we anticipate an exchange rate of R$/US$ 4.90, closely mirroring the inflation differential between Brazil and the United States for that period.

Agriculture and extractive industries have driven record trade surpluses
12M accum. (USD Bn)



Source: MDIC, XP

The trade balance continues to surprise positively. According to the latest data from the MDIC - Ministry of Development, Industry, Commerce, and Services -, and considering data up to the third week of February, the trade

balance grew by around US$ 6.0 billion in the first two months of 2024, compared to the same period in 2023. Exports are reaching new highs - notably because of the increasing contribution from crude oil - while imports have stabilized. In this scenario, we project the current account balance to reach -US$ 24.5 billion by the end of 2024 (-1.0% of GDP), significantly below the historical average. We also expect a net inflow of Foreign Direct Investment (FDI) to reach US$ 70.0 billion this year (3.0% of GDP). For 2025, we foresee the picture to be the same: we forecast the current account balance at -US$ 30.0 billion (-1.2% of GDP) and FDI inflows of US$ 75.0 billion (3.0% of GDP).

Inflation – We lowered the 2024 IPCA to 3.5% from 3.7%, on the heels of benign food dynamics and energy prices

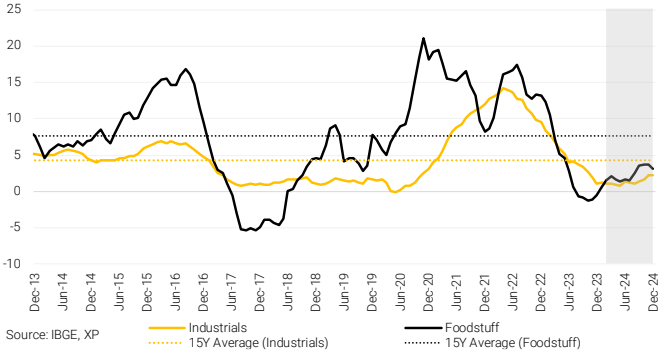
Alexandre Maluf

IPCA-15 reinforced the current framework of disinflation. The February mid-month IPCA-15 rose by 0.78%, roughly in line with market expectations. The high monthly variation - which should be repeated in the closed IPCA - is directly related to the readjustments in Education and the increase in state-level tax on fuels. In that reading, we were surprised by a lower-than-expected rise in food at home, reflecting a cooling in fresh food inflation, given the dissipation of the extreme climatic events associated with El Niño.

Nonetheless, services inflation remains stubborn. In line with previous readings, February's IPCA-15 did not bring good news regarding service prices and its underlying metrics. Considering the 3M SAAR, core services accelerated to 5.8% last month from 5.2% in January. Additionally, in the same metric, labor-intensive services rose to 6.2% from 5.9% - also well above the inflation 3% target. We expect services inflation to cool down throughout the year (we project 4.6% for underlying services), but the strength of the labor market and the fiscal and parafiscal expansion measures remain risk factors.

We reduced our projection for the 2024 IPCA to 3.5% from 3.7%. The adjustment was concentrated on food at home, whose short-term dynamics proved to be more benign than we expected. Of high relevance, grain prices - soybeans, wheat, and corn - have reached even lower levels recently and we expect that, at least in the case of corn, there is room for a further drop in prices. If our estimates prove correct, there will be additional disinflation of related goods (soybean oil, for example) and, consequently, of proteins. We project 3.1% for food at home this year.

Goods inflation should end 2024 below the historical average
IPCA, 12-M (%)



Source: IBGE, XP

IPCA Groups	Annual Change (%) 2022	2023	2024 Previous	2024 Current
Monitored prices	-3.8	9.1	4.1	3.9
Market-set prices	9.3	3.1	3.5	3.3
Food at home	13.2	-0.5	4.2	2.8
Industrials	9.6	1.1	2.1	2.3
Services	7.6	6.2	4.1	4.1
IPCA	**5.8**	**4.6**	**3.7**	**3.5**

Source: IBGE, XP

Moreover, the advance of funds from Eletrobras should ease electricity prices. According to the XP Political Analysis team and the press, the government should use the funds from the privatization of Eletrobras to anticipate some debts in the energy sector. The impact on the IPCA would be -0.1pp, according to our estimates. It's worth noting that the government is also interested in redistributing the sector's costs to customers in the **free energy market**, which would generate an additional drop in energy prices. Finally, another downside risk is the possibility that the Superior Court of Justice (STJ) will rule that the ICMS (state-level) tax on energy distribution and transmission tariffs is unconstitutional. If the court decides in favor of the consumers, the downward impact would be 0.4pp on the IPCA; but uncertainties remain about when the measure will take effect - potentially, it could occur in the coming years.

Labor-intensive services remain above the inflation target
IPCA-15 (%)

Source: IBGE, XP

But we have maintained our projection of 4.0% for the 2025 IPCA. Despite lower inflationary inertia, resilient economic activity and the overheated labor market should put additional pressure on services inflation. In addition, fiscal policy remains expansionary and news flow suggests that more rounds of parafiscal expansion are in the pipeline. As a result, medium-term inflation expectations remain at around 3.5%, making it even more difficult for the IPCA to converge on the 3.0% target. Finally, we expect some reversal in goods inflation towards the historical average (relatively high compared to the current target) next year. As a result, we continue to estimate 4.0% for the IPCA in 2025.

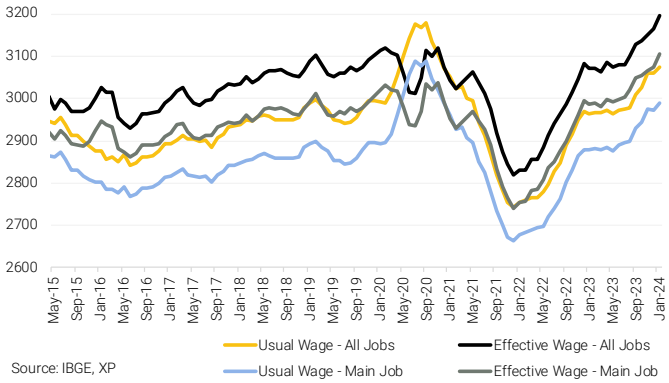
Monetary Policy – Benign short-term inflation allows the Copom to keep its forward guidance

Caio Megale

The outlook for short-term inflation remains benign. The effects of El Niño on food inflation are dissipating faster than expected, while wholesale price inflation (IPA, in Portuguese acronym) dived back into negative territory, suggesting lower goods prices at the consumer level in a couple of months. Many market participants and we are reducing IPCA forecasts for this year (see inflation section above).

Keeping the 50-pbs cut guidance. Considering the Selic rate is still comfortably above what we consider the neutral level (around 9.0%), we see the Copom keeping the easing pace ahead. Thus, we do not believe the committee will remove the forward guidance ("further reductions of the same magnitude in the next meetings") from its official communication this month.

Real wage growth is a risk for the conduct of monetary policy
Seasonally adjustes series (BRL)



Source: IBGE, XP

We continue to see the terminal rate at 9.0%... In our baseline scenario, we anticipate four additional 50-bps cuts and a final adjustment of 25 bps, taking the Selic rate to 9.0%, and staying there until at least 2025 yearend.

... though the (over)heated labor market seems an increasing risk. January official numbers showed the unemployment rate at its lowest level since the beginning of 2015 and real earnings increasing for the fifth month in a row. The real aggregate labor income – it combines employment and average labor earnings – surged 0.9% in January, marking the eight consecutive positive reading. This indicator is expected to increase 4.0% in the current year, after climbing circa 7% in 2023.

Strong labor market and fiscal transfers should keep aggregate demand stimulated, eventually limiting the room for monetary easing. Particularly considering that, despite the favorable short-term dynamics, **inflation and inflation expectations remain above the 3.0% target.**

Thus, we do not rule out the possibility that the Copom may opt for a pause before our 9.0% forecast.

1) This report was prepared by XP Investimentos CCTVM S.A. ("XP Investimentos or XP") according to the requirements provided in CVM Resolution 20/2021 and aims to provide information that can help the investors make their own investment decisions, and does not constitute any kind of offer or purchase request and/or sale of any product. The information contained in this report is considered valid on the date of disclosure and has been obtained from public sources. XP Investimentos is not liable for any decisions made by the customer based on this report.

2) This report was prepared considering the product risk classification in order to generate allocation results for each investor profile.

3) All of the views expressed in this research report accurately reflect the research analyst's personal views regarding any and all of the subject securities or issuers. No part of analyst(s) compensation was, is or will be, directly or indirectly related to the specific recommendations or views expressed in this research report.

4) The signatory of this report declare that the recommendations reflect solely and exclusively their personal analyses and opinions, which have been produced independently, including in relation to XP Investimentos and which are subject to modifications without notice due to changes in market conditions, and that their remuneration are indirectly affected by revenue from business and financial transactions carried out by XP Investimentos.

5) The analyst responsible for the content of this report and the compliance with CVM Resolution 20/2021 is indicated above, and, in the event of an indication of another analyst in the report, the person responsible will be the first accredited analyst to be mentioned in Report.

6) XP Investimentos' analysts are obligated to comply with all the rules laid down in the APIMEC's conduct code for the securities analyst and XP Investimentos' analyst of securities conduct policy.

7) Customer service is carried out by XP Investimentos employees or by autonomous investment agents who perform their activities through XP, in accordance with CVM Resolution 16/2021, which are registered in the national association of brokers and distributors of securities ("ANCORD"). The autonomous agent of investment may not provide consulting, administration or management of customer net worth, and must act as an intermediary and request prior authorization from the client for the realization of any operation in the capital market.

8) The products presented in this report may not be suitable for all types of customer. Before making any decisions, customers should ensure that the products presented are suitable for their investor profile. This material does not suggest any change of portfolio, but only guidance on products suitable to a certain investor profile.

9) The profitability of financial products may present variations and their price or value may increase or decrease in a short period of time. Past performance is not necessarily indicative of future results. Performance disclosed is not net of any applicable taxes. The information present in this material is based on simulations and the actual results may be significantly different.

10) This report is intended exclusively for to the XP Investimentos' network, including independent XP agents and XP customers, and may also be released on XP's website. It is prohibited to reproduce or redistribute this report to any person, in whole or in part, whatever the purpose, without the prior express consent of XP Investimentos.

11) XP Investimentos' ombudsman has the mission to serve as a contact channel whenever customers who do not feel satisfied with the solutions given by the company to their problems. The contact can be made via telephone 0800 722 3710 if you are in Brazil or via ombudsman form if you are in other localities: ttps://institucional.xpi.com.br/ouvidoria.aspx/.

12) The cost of the transactions billing policies are defined in the operational cost tables which are made available on XP Investimentos website: www.xpi.com.br.

13) XP Investimentos is exempt from any liability for any damages, direct or indirect, that come from the use of this report or its contents.

14) Technical analysis and fundamental analysis follow different methodologies. Technical analysis is performed following concepts such as trends, support, resistance, candles, volume, and moving averages, amongst others. Fundamental analysis uses as information the results disseminated by the issuing companies and their projections. In this way, the opinions of fundamental analysts, who seek the best returns given the market conditions, the macroeconomic scenario and the specific events of the company and the sector, may differ from the opinions of technical analysts, which aim to Identify the most likely movements on asset prices, using "stops" limit possible losses.

15) Investment in stocks is appropriate for moderate and aggressive profile investors, according to the suitability policy practiced by XP Investimentos. Equity investments available are portion a company's capital that is traded on the market. Stock is a variable financial investment (i.e. an investment in which profitability is not pre-established and varies depending on market quotations). Investment in stock is a high-risk investment and past performance is not necessarily indicative of future results and no statement or warranty, expressed or implied, is made in this material in relation to future performance. Market conditions, macroeconomic scenario, company and sector specific events can affect investment performance and may even result in significant asset losses. The recommended duration for equity investments is medium-long term. There is no guarantee of investment return for customers' investments in stock.

16) Investment in options is preferably indicated for aggressive profile investors, according to the suitability policy practiced by XP Investimentos. In options market, the purchase or sale rights of a good shall be negotiated at a price fixed at a future date, and the purchaser of the negotiated duty should pay a premium to the seller as in a secure agreement. Operations with these derivatives are considered very high risk for presenting high risk and return relationships and some positions present the possibility of losses higher than the capital invested. The recommended duration for the investment is short-term and the customer's assets are not guaranteed in this type of product.

17) Investment in terms is indicated for aggressive profile investors, according to the suitability policy practiced by XP Investimentos. They are contracts for the purchase or sale of a certain number of shares at a fixed price for settlement within a specified period. The term of the contract is freely chosen by the investors, complying with the minimum period of 16 days and a maximum of 999 days. The price will be the value of the added share of a portion corresponding to the interest-which are set freely on the market, depending on the term of the contract. Every transaction in the term requires a guarantee deposit. These guarantees are provided in two forms: coverage or margin.

18) Investments in futures markets are subject to significant loss of principal, and are therefore appropriate for aggressive profile investors, according to the suitability policies practiced by XP Investimentos. A commodity is an object or price determinant of a future contract or other derivative instrument, which may substantiate an index, a fee, a movable value or a physical product. Commodities are considered high risk investments, which include the possibility of price fluctuation due to the use of financial leverage. The recommended duration for commodity investments is short-term and customers' assets are not guaranteed in this type of product. Market conditions and the macroeconomic scenario can affect the performance investments.

19) This institution is adhering ANBIMA Code of Regulation and best practices for the distribution activity of retail investment products.
