Brazil Macro Monthly

Stronger inflation pressures, higher interest rates

- The short-term economic outlook in the US remains benign, although election results raise concerns about the global economic outlook ahead. We expect a gradual global monetary easing ahead, with the Fed funds rate stabilizing at 3.5% by 2025 YE.
- In Brazil, we forecast that GDP will grow 3.1% in 2024 and 1.8% in 2025. This scenario of slowdown reflects the further tightening of financial conditions, reduced fiscal impulse, and the end of spare capacity of production factors.
- We expect the government to reach the lower limit of the primary result target this year, but the 2025 budget remains challenging. We believe that the spending reduction package under discussion will be fundamental to ensure the sustainability of the fiscal framework.
- Global and domestic factors are contributing to the exchange rate depreciation, which recently reached its highest level since early 2021. We now forecast 5.70 reais per dollar at 2024YE and 5.50 at 2025YE, reflecting the widening interest rate differential.
- We estimate an IPCA of 4.9% in 2024 (previously 4.6%), following the protein prices spike. We have also raised our projection for inflation for 2025, from 4.1% to 4.7%, explained by pressures on foodstuff and upward adjustments in fuel and electricity.
- We see the Selic rate at 13.25% at the peak of the tightening cycle (12.00% before), after four additional 50-bp hikes. The committee may opt to increase the pace to reach the terminal level earlier. This more forceful approach should open room for some easing by 2H25.

Foreword – BCB reaction needs to be more intense than anticipated

By August, when we first incorporated a tightening cycle in our baseline scenario, a 12.00% Selic rate seemed enough to stabilize IPCA inflation within the target range. However, the inflation outlook has deteriorated further since then.

All inflation drivers worsened. Growth beat expectations, narrowing the output gap. Indeed, the unemployment rate and capacity utilization in the manufacturing sector have been at their lower/higher level for many years. The exchange rate reached its weakest level since 2021 (-14.6 YTD). 2025 inflation expectations rose, approaching the upper bound of the target range.

Under those circumstances, IPCA over the relevant horizon (mid-2026) seems more likely to stand above the upper limit (4.5%) than close to the 3.0% target – as a matter of fact, our forecasts for 2024 and 2025 are already above that level. This requires an even tighter monetary policy. Thus, we now see the Selic rate reaching 13.25% (12.00% before). This prompter approach opens room for some easing by the end of 2025 – we anticipate two 50-bps cuts in November and December.

Challenges also persist on the fiscal front. Meeting the zero-deficit target demands some BRL 200 billion in addition revenues, which are hard to achieve. Quasi-fiscal expenditures are also on the rise, which is not incorporated in the target but puts pressure on government debt, nonetheless. It does not bode well with the stable inflation pursued by the Central Bank.

At the end of the day, the old cliché holds: the picture is good (strong growth, relatively low inflation, comfortable trade surplus, solid tax revenues), but the movie is worrying. The uncertain macro sustainability is reflected in the bad price action of Brazilian asset prices in recent weeks. Buy opportunity? It depends on how effective the policy reaction will be.

And, naturally, on how the global economy will react to the Trump mandate in the US and to Chinese economic stimulus.

Global backdrop – Red sweep... what now?

Francisco Nobre

US election results raise uncertainty about the global economic outlook. Donald Trump´s victory, combined with the Republican party securing a majority in both Houses, tends to intensify potential economic impacts: higher US growth (at least in the short term), stronger USD, additional inflation pressures, higher rates, intensified fiscal concerns, and increased trade barriers (especially with China). The latter is of particular concern, as it could pressure inflation at a global level, and would be contractionary for global growth and productivity. A less open US economy tends to have a more direct impact in China, Germany, and Mexico, although it is also likely to lead to spillover effects in other economies. Regarding EMs, currency depreciation amid the stronger USD tends to be more intense than that of DM currencies.

Short-term risks back to balance in the US... On the economic front, data was net hawkish over the past month, suggesting that the economy remains strong. Q3 GDP registered a quarterly annualized growth rate of 2.8%, and concerns over a deterioration in the labor market have eased. On the inflation front, short-term dynamics remain relatively benign, although the final stage of the disinflation process will be challenging (bringing core PCE south of 2.5%) given the resilient labor market, expansionary fiscal stance, and inflationary political and geopolitical risks.

... and a more moderate easing pace by the Fed. The Fed cut rates by 25 bps in November, marking a deceleration in the easing pace from September. Market pricing for the upcoming rate cuts, which was divided between 25 bps and 50 bps last month, is now attributing considerable probability of skips between meetings (graph). **Key for emerging markets like Brazil, Treasury bond yields increased some 70 bps since last month,** partly due to solid data but also because of a "Trump Trade," which considers higher inflation and interest rates ahead. Our baseline scenario continues to incorporate another cut in December, followed by one cut in every two meetings in 2025, to a terminal rate of 3.5% by the end of the year.

Room for monetary easing is clearer in Europe. In the Eurozone, the ECB has started to cut rates in back-to-back meetings after starting the easing cycle by skipping between meetings. Market pundits even consider an acceleration to a

50 bp cut, although it has become less likely after the strong GDP and services inflation readings released last month. We expect cuts to be gradual, until lowering the deposit rate (currently at 3.25%) of 2.25% by 3Q25. In the UK, the BoE cut rates by 25 bps for the second time, taking the Bank Rate to 4.75%, and we expect a terminal level of 3.25% by 2025 YE.

Moderate Chinese growth; stable commodities. Some economic indicators in China were stronger in October, reflecting the series of policy measures in late September to bolster an economic turnaround. However, the improvement has been moderate, as expected. Achieving China's 5% growth target for 2024 will depend on a sustained recovery in consumer demand, as well as additional stimulus measures. Commodity prices, which are sensitive to China´s growth dynamics, have been broadly table lately, while Brent oil prices continue to react to ongoing geopolitical instability in the Middle East.

BRAZIL – Stronger inflation pressures, higher interest rates

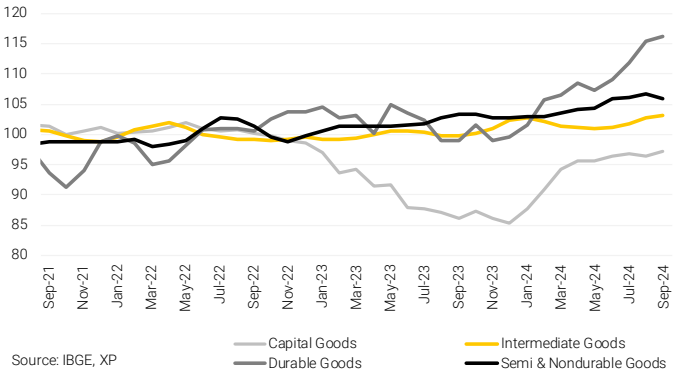
Activity – Gradual deceleration throughout 2025

Rodolfo Margato

Solid consumption drivers in the short term. Employment and income continue to rise, supporting domestic demand. The unemployment rate reached 6.2% in September (monthly and seasonally adjusted estimates), the lowest level in the data series that began in 2012. Most sectors are reporting net job creation. Against this backdrop, real wages remain on a growth path, although more moderately compared to recent quarters. Furthermore, credit concessions are growing, which also helps short-term consumption.

GDP is expected to grow slightly above 3% this year. We estimate that GDP increased by 0.6% QoQ in 3Q24 (3.8% YoY). The manufacturing industry performed better than expected, with emphasis on the durable goods category. In turn, the retail and services sectors have lost steam in recent months, although their breakdown figures remain mostly positive. As a result, we continue to forecast a 3.1% growth for 2024 GDP, with a slight upward bias.

Durable goods production has grown strongly in recent quarters, mostly driven by vehicles
Seasonally adjusted series. 3MMA. 2022 = 100



Source: IBGE, XP

Commodity-linked sectors are expected to surge next year… Grain harvest could hit an all-time high in 2025, particularly the soybean output (double-digit expansion). Weather conditions have improved in recent weeks, and most agricultural crops are likely to show an increase in harvested area and production. This favorable dynamic will more than offset the contraction in livestock activities. The extractive industry will also stand out in the coming quarters, driven by the oil & gas sector. According to our estimates, the primary sector will contribute 0.5pp to the overall GDP growth in 2025.

… while sectors more sensitive to the economic cycle will slow down. The even more contractionary monetary policy (see the last section of this report) and the reduced fiscal impulse mostly explain our expectation of a cooling domestic demand throughout 2025, leading to more moderate growth in the manufacturing industry, retail, and services sector – see projections in the table. We estimate that the GDP most sensitive to the economic cycle (total GDP excluding agriculture and extractive industry) will rise slightly below 1.5% next year.

We continue to expect GDP to increase by 1.8% in 2025. All things considered, GDP should grow close to its potential next year. The output gap – for which we estimate around 1pp at the end of 2024 – is likely to narrow modestly, remaining in positive territory.

Sectors less sensitive to economic policy should increase sharply in 2025
Seasonally adjusted data series. 2012=100.

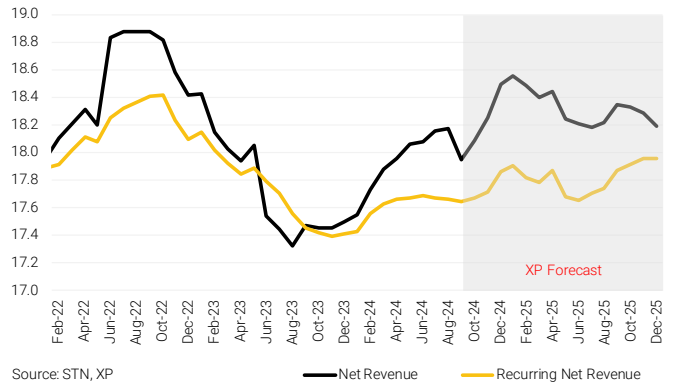
Public finance – A shift in focus is key to fiscal sustainability

Tiago Sbardelotto

September's results continued to disappoint. While tax revenues hit record levels, growing 9.7% in real terms through September, the central government posted another deficit for the month, bringing the year-to-date deficit to around BRL 105.2 billion — or BRL 88.0 billion when excluding BRL 17.3 billion in exceptional expenses for Rio Grande do Sul and other exemptions from the target. Thus, to meet the lower limit of the primary balance target (a deficit of BRL 28.8 billion), the government needs to generate a surplus of BRL 59.2 billion in the last three months — a daunting challenge.

Still, we believe there is a good chance the primary deficit will stay within the target range. This projection is based on two main assumptions: i) extraordinary revenues of BRL 35.5

Revenue increase in 2024 was based on extraordinary measures
Net revenue and recurring net revenue (% of GDP)



Source: STN, XP

billion from compensations for payroll tax exemption and dividends from state-owned companies; and ii) expenditures running up to BRL 30 billion below government projections. We now expect a total primary deficit of **BRL 54.0 billion (0.5% of GDP)**, slightly better than our previous forecast of BRL 66.1 billion (0.6% of GDP), due to lower spending on extraordinary credits. Considering the exceptions to the primary balance target — estimated at BRL 24.7 billion — the deficit should reach **BRL 28.3 billion (0.3% of GDP)**, just BRL 0.5 billion above the lower limit of BRL 28.8 billion.

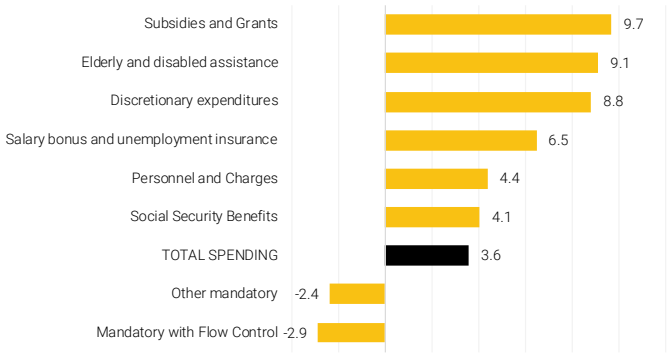
Balancing 2025 remains a challenge. As this year, the budget proposal for 2025 includes BRL 168.3 billion in additional revenues related to several highly uncertain measures with a low probability of realization. Of particular note is the payroll tax exemption, which is not included in the budget but has been extended until 2027 (with a gradual reduction over time). As a result, the government will now have to find additional revenue-raising measures to compensate for the BRL 25.8bn revenue loss associated with this tax benefit.

We estimate a deficit of BRL 73.9 billion (0.6% of GDP), excluding court-ordered payments beyond the constitutional limit. Our assumptions do not include the approval of contingent measures or revenues from CARF, considering this year's disappointments. **For the full primary balance indicator (including court-ordered payments), we estimate a deficit of BRL 114.3 billion (0.9% of GDP).**

States are making strides toward balance, but municipalities may face setbacks. State-level data shows current revenues and expenses growing by around 7.0% and 7.3% through June (relatively balanced). However, we see deterioration in municipal accounts, partly due to the political cycle. **We project a deficit of BRL 41.6 billion in 2024 (0.4% of GDP) and BRL 99.6 billion in 2025 (0.8% of GDP) for the consolidated public sector.**

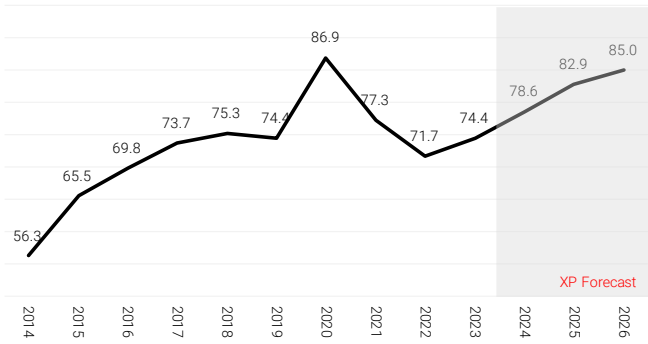
Meeting the target will not necessarily stabilize the public debt. As we have noted, the total primary deficit will be considerably larger due to off-target expenditures. Additionally, nominal interest costs, foreign exchange swaps, and financial support to public banks are likely to strain public debt further. We estimate that the gross government debt-to-GDP ratio (DBGG) will reach 78.6% in 2024 and 82.9% in 2025. Meanwhile, net public sector debt is expected to grow more moderately, thanks to currency devaluation, with the DLSP/GDP ratio projected at 63.2% by year-end and 65.7% next year.

Spending growth will continue to pressure the limit next year
Real YoY change in spending (%)



Source: Tesouro Nacional, XP

Debt is expected to grow 4pp this year, even if the primary result target is met
General government gross debt (% of GDP)



Source: BCB, XP

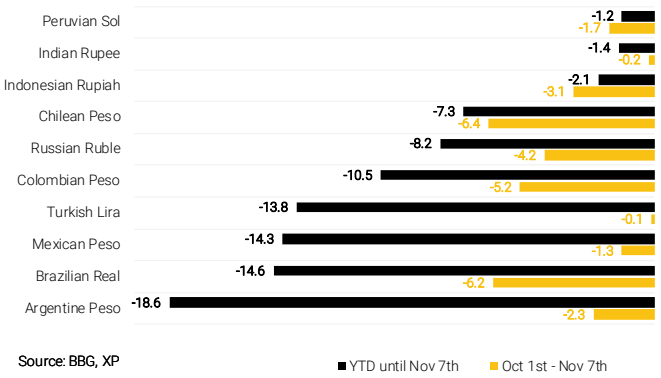
A shift in focus is key to ensuring fiscal sustainability. After insisting on a strategy of fiscal adjustment by increasing revenue, the government is finally due to announce a package of spending cuts. We expect the changes to affect programs such as unemployment insurance, wage bonus and BPC, as well as the indexation of health and education minimums, with potential savings of BRL 32.7 billion by 2026 (see our report here). These measures are essential to slow the growth of mandatory expenses so they do not crowd out all room for discretionary spending, which could otherwise compromise the fiscal framework. Although important, we believe these adjustments will fall short of ensuring long-term fiscal sustainability, as deeper changes will likely be needed, including de-indexing benefits.

External Accounts – Increased exchange rate pressure from global and domestic factors

Rodolfo Margato

The exchange rate has depreciated sharply in recent periods. The BRL rose from around 5.45 dollars in early October to 5.80 in November, its highest level since March 2021. This depreciation is driven by both global and local factors. Globally, rising US Treasury yields and uncertainties surrounding the presidential elections (with a prevailing expectation of a strong dollar). In Brazil, concerns over fiscal and quasi-fiscal matters have recently intensified, particularly regarding the increase in mandatory spending and the potential use of public and private funds to finance expenditures beyond the limits of the current fiscal framework (see the section on 'Public Accounts').

The BRL is among the worst performers of the year
Variation (%). Negative = depreciation.

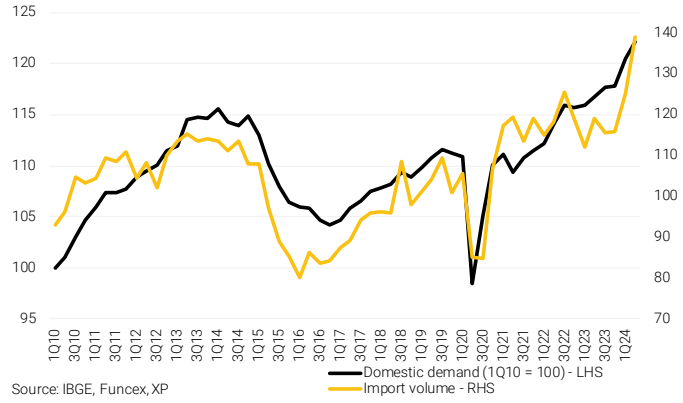


Source: BBG, XP

In the scenario, we have adjusted our forecast for the exchange rate to 5.70 reais per dollar by the end of 2024 (previously 5.40) and 5.50 by the end of 2025 (previously 5.40). In our view, the factors leading to the recent BRL depreciation are unlikely to disappear in the near future. We see some decompression next year, mainly due to the widening of the interest rate differential.

On the Balance of Payments front, the strong domestic demand continues to weigh on imports. The trade balance posted a surplus of nearly USD 52.9 billion between January and September this year, down from USD 67.1 billion during the same period last year. This decline is largely explained by falling prices of key Brazilian export commodities, combined

Domestic demand boosted imports in 2024
Seasonally adjusted series



Source: IBGE, Funcex, XP

with a broad increase in imports. Meanwhile, export volumes remain high, with crude oil gaining an increasing share. We therefore expect the trade surplus to end 2024 at USD 72 billion, down from USD 92 billion last year. In 2025, we expect some recovery in the trade balance to USD 82 billion driven by slower domestic absorption, FX depreciation, and higher volumes of primary goods exports.

Significant increase in current account deficit in 2024, with stabilization in 2025. The Primary Income account remains stable compared to last year. Meanwhile, the Services account deficit is expected to grow from USD 41 billion to USD 49 billion annually. Stronger-than-expected economic activity and structural changes in some categories (e.g., intellectual property/streaming services) are driving this trend. Consequently, we project a current account deficit of USD 52.0 billion by the end of 2024 (2.4% of GDP), up from USD 21.7 billion at the end of 2023 (1.0% of GDP). Some stabilization in the current account deficit is anticipated for 2025 (USD 50.0 billion or 2.2% of GDP), as slower economic activity is expected to reduce the demand for imports and services. For the financial account, we expect net inflows of USD 74.0 billion in Foreign Direct Investment next year (3.2% of GDP), slightly above the USD 70.0 billion projected for this year (3.2% of GDP). For more information, see the special report "Balance of Payments Retrospective: Surprises and Hot Topics in 2024".

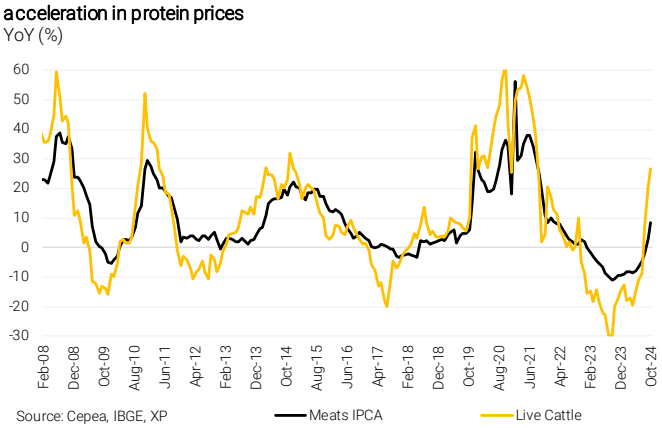
Inflation – IPCA above the upper bound of the target in 2024 and 2025

Alexandre Maluf

Inflation pressures persist in the short term. The October IPCA accelerated to 0.56% compared to September, with a challenging composition. The average of core gauges, as well as the underlying inflation measures for services and industrial goods, remained above the target in the annualized and seasonally adjusted metrics. The trends that drove inflation upwards in October are expected to continue.

In this context, we raised our 2024 IPCA forecast from 4.6% to 4.9% for 2024. Live cattle prices have increased beyond our expectations, raising our forecasts for the inflation of beef and other proteins, such as chicken and pork – we foresee food-at-home inflation at 8.6% this year (previously 7.1%). Consequently, we have slightly increased our outlook for food away from home, also incorporating the upside surprise in

Relevant rise in live catlle prices will be translated into sharp acceleration in protein prices



Source: Cepea, IBGE, XP

October. Services, in general, are expected to remain pressured by strong economic activity, while industrial goods, in addition to heated demand, will also reflect this year's currency depreciation. Additionally, we have raised our projection for airline ticket prices in December, following stronger-than-expected price collections. On the other hand, we revised our projection for the energy tariff flag for December from yellow to green, which will negatively impact IPCA by ~10bps.

Short-term pressure will also affect the early months of next year. **We have raised our IPCA projection for 2025 from 4.1% to 4.7%,** reflecting economic fundamentals and non-cyclical factors. Here are the details:

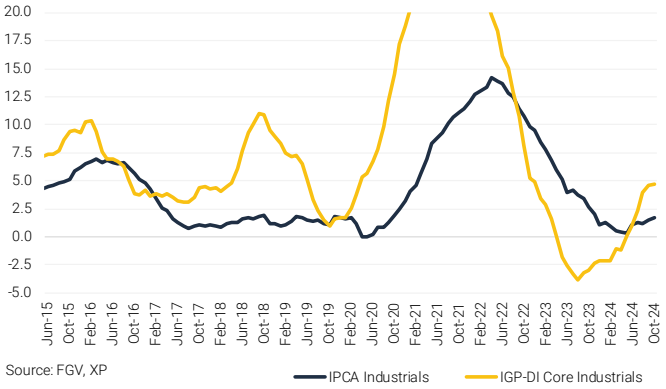
i) Proteins and exchange rate. Regarding non-cyclical elements, **we have increased our food inflation projection from 5.2% to 7.0%**, once again reflecting higher protein prices next year, due to the impacts of the livestock cycle reversal. For industrial goods inflation, we maintain our estimate at 2.7%, with currency depreciation being offset by a structurally bearish view on commodities, resulting from the global economic slowdown. This figure represents an underlying acceleration compared to 2024, as this group was influenced this year by the strong rise in ethanol and tobacco prices, which is not expected to repeat in 2025.

ii) Regulated goods also explain the increase in next year's projection. Our 'green flag' projection for electricity fares in 2024 imposes a 0.1 p.p. increase in the IPCA for 2025. Additionally, state governments have announced increases in ICMS taxes on fuels in 2024, which will also have a bullish effect of 0.1 p.p. on inflation. All things considered; we project an increase in monitored goods of 4.2% (previously 3.5%).

We project an acceleration in services inflation from 4.6% in 2024 to 5.2% in 2025. Despite the expected slowdown in GDP next year (see the activity section above), i) the output gap is expected to remain tight; ii) the minimum wage and other wage metrics should continue to rise (albeit more moderately); iii) inflation expectations should remain considerably above the target; and iv) idiosyncratic factors affecting some categories will sustain high inflation in this group.

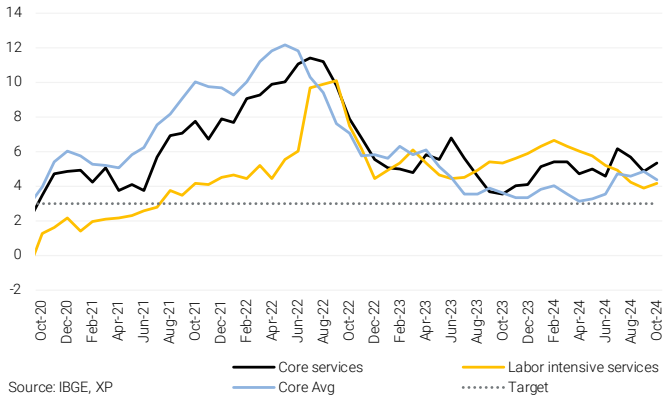
Among these idiosyncratic factors (item iv above), we highlight food away from home is expected to register a higher level in 2025, reflecting significant increases in food prices in the last quarter and throughout the next year. Rents inflation is also expected to accelerate, due to higher inflation indices (IGP-M

Industrialized goods inflation expected to accelerate ahead
YoY (%)



Source: FGV, XP

Services gauges remain above the target
IPCA. 3M-SAAR (%)



Source: IBGE, XP

and IPCA). Condominium is also expected to be adjusted to levels equivalent to or higher than this year's, as they are responsive to minimum wage levels and water and sewage tariffs – for which we project acceleration in 2025. Following the same logic, prices for personal and medical services are expected to exceed the target. Finally, adjustments in tuition should remain at levels like those of 2024.

In all, the recent deterioration of inflation determinants is expected to keep the IPCA above the upper limit of the tolerance band of the target (4.5%), making the Central Bank's task even more challenging.

Monetary Policy – We now see the terminal Selic rate at 13.25%

Caio Megale

Considering the risks mentioned in the inflation section, we believe that IPCA is more likely to stay above the upper bound of the target range than close to the 3.0% target.

Accordingly, we now see the Selic rate reaching 13.25% at the peak of the tightening cycle (12.00% before), after four additional 50-bp hikes. The board may, however, opt to accelerate the pace to reach the terminal level faster.

This prompter approach opens room for some easing by the end of next year. As the relevant horizon moves towards the end of 2026, the IPCA forecast tends to get closer to the target, allowing a less restrictive monetary policy. Thus, we anticipate two 50-bps cuts in November and December. The easing cycle should continue through 2026, heading gradually to the neutral level (the Selic rate at around 9-10% in nominal terms).

2026 inflation expectations are a key risk going forward. This Selic rate trajectory is consistent, in our view, with inflation stabilizing within the target range. A key risk, however, is if the current monetary reaction proves not enough to prevent medium-term expectations from rising, particularly 2026 IPCA forecasts. In that case, the Selic rate may go beyond our 13.25% projection, as shown by the simulations in the table.

Disclaimer

1) This report was prepared by XP Investimentos CCTVM S.A. ("XP Investimentos or XP") according to the requirements provided in CVM Resolution 20/2021 and aims to provide information that can help the investors make their own investment decisions, and does not constitute any kind of offer or purchase request and/or sale of any product. The information contained in this report is considered valid on the date of disclosure and has been obtained from public sources. XP Investimentos is not liable for any decisions made by the customer based on this report.

2) This report was prepared considering the product risk classification in order to generate allocation results for each investor profile.

3) All of the views expressed in this research report accurately reflect the research analyst's personal views regarding any and all of the subject securities or issuers. No part of analyst(s) compensation was, is or will be, directly or indirectly related to the specific recommendations or views expressed in this research report.

4) The signatory of this report declare that the recommendations reflect solely and exclusively their personal analyses and opinions, which have been produced independently, including in relation to XP Investimentos and which are subject to modifications without notice due to changes in market conditions, and that their remuneration are indirectly affected by revenue from business and financial transactions carried out by XP Investimentos.

5) The analyst responsible for the content of this report and the compliance with CVM Resolution 20/2021 is indicated above, and, in the event of an indication of another analyst in the report, the person responsible will be the first accredited analyst to be mentioned in Report.

6) XP Investimentos' analysts are obligated to comply with all the rules laid down in the APIMEC's conduct code for the securities analyst and XP Investimentos' analyst of securities conduct policy.

7) Customer service is carried out by XP Investimentos employees or by autonomous investment agents who perform their activities through XP, in accordance with CVM Resolution 16/2021, which are registered in the national association of brokers and distributors of securities ("ANCORD"). The autonomous agent of investment may not provide consulting, administration or management of customer net worth, and must act as an intermediary and request prior authorization from the client for the realization of any operation in the capital market.

8) The products presented in this report may not be suitable for all types of customer. Before making any decisions, customers should ensure that the products presented are suitable for their investor profile. This material does not suggest any change of portfolio, but only guidance on products suitable to a certain investor profile.

9) The profitability of financial products may present variations and their price or value may increase or decrease in a short period of time. Past performance is not necessarily indicative of future results. Performance disclosed is not net of any applicable taxes. The information present in this material is based on simulations and the actual results may be significantly different.

10) This report is intended exclusively for to the XP Investimentos' network, including independent XP agents and XP customers, and may also be released on XP's website. It is prohibited to reproduce or redistribute this report to any person, in whole or in part, whatever the purpose, without the prior express consent of XP Investimentos.

11) XP Investimentos' ombudsman has the mission to serve as a contact channel whenever customers who do not feel satisfied with the solutions given by the company to their problems. The contact can be made via telephone 0800 722 3710 if you are in Brazil or via ombudsman form if you are in other localities: ttps://institucional.xpi.com.br/ouvidoria.aspx/.

12) The cost of the transactions billing policies are defined in the operational cost tables which are made available on XP Investimentos website: www.xpi.com.br.

13) XP Investimentos is exempt from any liability for any damages, direct or indirect, that come from the use of this report or its contents.

14) Technical analysis and fundamental analysis follow different methodologies. Technical analysis is performed following concepts such as trends, support, resistance, candles, volume, and moving averages, amongst others. Fundamental analysis uses as information the results disseminated by the issuing companies and their projections. In this way, the opinions of fundamental analysts, who seek the best returns given the market conditions, the macroeconomic scenario and the specific events of the company and the sector, may differ from the opinions of technical analysts, which aim to Identify the most likely movements on asset prices, using "stops" limit possible losses.

15) Investment in stocks is appropriate for moderate and aggressive profile investors, according to the suitability policy practiced by XP Investimentos. Equity investments available are portion a company's capital that is traded on the market. Stock is a variable financial investment (i.e. an investment in which profitability is not pre-established and varies depending on market quotations). Investment in stock is a high-risk investment and past performance is not necessarily indicative of future results and no statement or warranty, expressed or implied, is made in this material in relation to future performance. Market conditions, macroeconomic scenario, company and sector specific events can affect investment performance and may even result in significant asset losses. The recommended duration for equity investments is medium-long term. There is no guarantee of investment return for customers' investments in stock.

16) Investment in options is preferably indicated for aggressive profile investors, according to the suitability policy practiced by XP Investimentos. In options market, the purchase or sale rights of a good shall be negotiated at a price fixed at a future date, and the purchaser of the negotiated duty should pay a premium to the seller as in a secure agreement. Operations with these derivatives are considered very high risk for presenting high risk and return relationships and some positions present the possibility of losses higher than the capital invested. The recommended duration for the investment is short-term and the customer's assets are not guaranteed in this type of product.

17) Investment in terms is indicated for aggressive profile investors, according to the suitability policy practiced by XP Investimentos. They are contracts for the purchase or sale of a certain number of shares at a fixed price for settlement within a specified period. The term of the contract is freely chosen by the investors, complying with the minimum period of 16 days and a maximum of 999 days. The price will be the value of the added share of a portion corresponding to the interest-which are set freely on the market, depending on the term of the contract. Every transaction in the term requires a guarantee deposit. These guarantees are provided in two forms: coverage or margin.

18) Investments in futures markets are subject to significant loss of principal, and are therefore appropriate for aggressive profile investors, according to the suitability policies practiced by XP Investimentos. A commodity is an object or price determinant of a future contract or other derivative instrument, which may substantiate an index, a fee, a movable value or a physical product. Commodities are considered high risk investments, which include the possibility of price fluctuation due to the use of financial leverage. The recommended duration for commodity investments is short-term and customers' assets are not guaranteed in this type of product. Market conditions and the macroeconomic scenario can affect the performance investments.

19) This institution is adhering ANBIMA Code of Regulation and best practices for the distribution activity of retail investment products.
